```
Write code to create a list of all
                                          Generate a snippet of code to extract
                                          all the URLs from the given string.
prime numbers between 2 and 100.
Input:
                                          Input:
                                          This string contains some urls such as
N/A
                                          https://www.google.com and
                                          https://www.facebook.com.
                                          Output:
Output:
def find_primes(n):
                                          import re
    prime_list = \lceil 2 \rceil
